19. KEY WORDS (Continue on reverse side if necessary and identify by block number) DAMS, INSPECTION, DAM SAFETY, West Branch Dam Naugatuck River Basin Torrington, Conn.		
20. ABSTRACT (Continue on reverse side if necessary and identify by block number) The West Branch Dam has a tributary watershed of 33.3 square miles. The pond has a water surface area of 5.5 acres and a storage capacity with the water level at the crest of the dam of 72 acre-feet. The spillway consists of 107 ft. long concrete oggee section with 8 ft. of freeboard. In addition, an intake chamber with two 42 inch sluice gates discharges to a canal which can divert water back to the river channel over a 34 ft. concrete spillway. The main spillway has a capacity of about 8,200 cfs before overtopping the right portion of the dam. The West Branch Dam is classified as "Small" in size because of its 72 acre-feet of storage capacity.

Re: West Branch Dam a/k/a Church Street Dam  
Torrington, Connecticut

Gentlemen:

Following field surveys and a dam failure analysis of West Branch Dam (a/k/a Church Street Dam), we conclude that the dam should be reclassified as having a low hazard potential.

We are enclosing a brief letter report substantiating our findings.

Very truly yours,  
ROALD HAESTAD, INC.

### DESCRIPTION

WEST BRANCH DAM A/K/A CHURCH STREET DAM  
CT 00101  
TOWN OF TORRINGTON, COUNTY OF LITCHFIELD  
ON THE WEST BRANCH OF THE NAUGATUCK RIVER  
OWNED BY: LAND TRUST, J. ERIC CHADWICK, TRUSTEE

The West Branch Dam consists of, from right to left, a 100 foot long earth embankment with an intake structure to a downstream canal, a 107 foot long concrete ogee section, and a 160 foot long earth embankment with a concrete core wall. The intake structure to the downstream canal contains two 42-inch sluice gates which discharge to the canal. The canal is separated from the river channel by an earth embankment which contains a 34 foot long auxiliary spillway. This spillway discharges into the river downstream of the dam. In the past, water from the canal would flow through a 36-inch reinforced concrete pipe (RCP) to a downstream manufacturing plant. The low level outlet, or blow-off, consists of a 48-inch RCP located to the left of the main spillway section and is controlled by a manually operated sluice gate. The dam has an overall length of 370 feet and a maximum height of 22 feet.

The dam overtopped and failed during the August 1955 flood and washed out the earth embankment to the left of the main spillway section. This section was rebuilt in 1956 as an earth embankment with a concrete core wall.

The dam is owned by Land Trust and presently serves no useful purpose to them.

The dam appears to be in fair condition and requires some work.

## EVALUATION OF HYDRAULIC/HYDROLOGIC FEATURES

The West Branch Dam has a tributary watershed of 33.3 square miles. The pond has a water surface area of 5.5 acres and a storage capacity with the water level at the crest of the dam of 72 Acre-Feet.

The spillway consists of a 107 foot long concrete ogee section with 8 feet of freeboard. In addition, an intake chamber with two 42-inch sluice gates discharges to a canal which can divert water back to the river channel over a 34 foot concrete spillway. The main spillway has a capacity of about 8,200 cfs before overtopping the right portion of the dam.

In accordance with the Corps of Engineers' Recommended Guidelines for Safety Inspection of Dams, the West Branch Dam is classified as "Small" in size because of its 72 Acre-Feet of storage capacity. The dam's height of 22 feet is below the minimum requirement of 25 feet for a "Small" dam.

The dam overtopped and failed during the August 1955 Flood, washing out the embankment to the left of the spillway. This section was rebuilt in 1956 as an earth embankment with a concrete core wall. Since then, the Hall Meadow Brook Flood Control Dam has been constructed on the upstream watershed.

Plans for the original dam and for the 1956 reconstruction are available, but no design computations were found.

A dam breach analysis was made using the Corps of Engineers' "Rule of Thumb" guidance for estimating downstream dam failure hydrographs. Failure was assumed with the water level at the top of the dam. Full spillway flow was assumed to continue after the

dam breach. Thus the spillway capacity was added to the dam breach flow and routed downstream. The above assumption was consistent with the 1955 failure of the dam.

The peak dam breach discharge including spillway flow was calculated to be 23,500 cfs. The flood was routed to a point 1000 feet downstream of the South Main Street bridge where the flow was well within the channel limits. Beyond this point the channel increases in size. The flood was found not to overflow the channel at any of the sections. Loss of life or significant property damage from a failure of the West Branch Dam is considered unlikely. Therefore, the dam is classified as "Low" potential hazard. See Appendix C for Calculations and Plan showing Limits of Potential Flooding.

SUBJECT...WEST BRANCH DAM - Dam breach calculations.....

$S = \text{Storage at time of failure} = \text{Storage at spillway level} + \text{Storage of freeboard}$

$$S = [5.5 \text{ acres} \times 5 \text{ ft}] + [5.5 \text{ acres} \times 8 \text{ ft}] \quad \text{ESTIMATE AVERAGE DEPTH} = 5'$$

$$S = 71.5 \text{ use } 72 \text{ ac-ft} \quad \text{FREEBOARD} = 8'$$

$$Q_{p1} = \text{Peak Failure Outflow} = \frac{8}{27} W_b \sqrt{g} Y_o^{3/2}$$

$$W_b = \text{Breach Width} = 40\% \text{ of dam length across river at mid height} = 0.4(220) = 88 \text{ ft}$$

$$Y_o = \text{Total height from river bed to pool level at time of failure} = 22 \text{ ft}$$

$$Q_{p1} = \frac{8}{27} (88) (\sqrt{32.2}) (22)^{3/2} = 15,268 \text{ use } 15,270 \text{ cfs}$$

In the 1955 flood the West Branch Dam failed. The failure occurred at the embankments and the spillway was left intact. Therefore a similar failure was assumed and 100% of the spillway discharge at time of failure is added to the Peak Failure Outflow to determine the total discharge.

$$\text{Spillway Discharge at time of failure} = CLH^{3/2}$$

$$C = 3.4 \quad L = 107' \quad H = 8'$$

$$Q_{peak} = 3.4(107)(8)^{3/2} = 8,232 \text{ use } 8,230 \text{ cfs}$$

$$\text{Total Discharge} = Q_{p1} + Q_{peak}$$

$$= 15,270 \text{ cfs} + 8,230 \text{ cfs} = 23,500 \text{ cfs}$$

MANNING COEFFICIENT=N=.0330

STORAGE AT TIME OF FAILURE=S= 72 AC. FT.

LENGTH OF REACH=L= 1000 FT.

INFLOW INTO REACH=QP1=11818 CFS

DEPTH OF FLOW=H1= 8.2 FT.

CROSS SECTIONAL AREA=A1= 832 SQ. FT.

STORAGE IN REACH=V1= 19.1 AC. FT.

TRIAL REACH OUTFLOW=QP(TRIAL)= 8682 CFS

TRIAL DEPTH OF FLOW=H(TRIAL)= 6.9 FT.

TRIAL CROSS SECTIONAL AREA=A(TRIAL)= 678 SQ. FT.

TRIAL STORAGE IN REACH=V(TRIAL)= 15.6 AC. FT.

REACH OUTFLOW=QP2= 8972 CFS

DEPTH OF FLOW=H2= 7.0 FT.

SUBJECT WEST BRANCH DAM - Flood Routing

BY SAL.....DATE 4/28/80 **ROALD HAESTAD, INC.** SHEET NO 14 OF 14.....  
CONSULTING ENGINEERS  
CKD BY RLS DATE 5/12/80 37 Brookside Road - Waterbury, Conn. 06708 JOB NO 049-18.....  
SUBJECT WEST BRANCH DAM - Areas.....

Planimeter Readings:

1) Surface Area; Third = 1.94 sq in 0.06  
First = 1.82 sq in 0.06  
Start = 1.76 sq in

$$0.06 \text{ in}^2 \times \frac{(2000 \text{ ft})^2}{\text{in}^2} \times \frac{1 \text{ acre}}{43,560 \text{ ft}^2} = 5.5 \text{ acres}$$

2) Watershed Area; Third = 10.28 sq in 2.90  
First = 4.45 sq in 2.86  
Start = 1.59 sq in

$$2.90 \text{ in}^2 \times \frac{(2000 \text{ ft})^2}{\text{in}^2} \times \frac{1 \text{ sq mi}}{(5,280 \text{ ft})^2} = 0.42 \text{ sq mi}$$

The 0.42 sq mi watershed consists of the watershed located between the Dam and Gaging Station.

The watershed for the West Branch Dam is equal to the watershed for the Gaging Station minus the 0.42 sq mi watershed. From the 'U.S. Geological Survey Water-Data Report CT-76-1', the Gaging Station Watershed is equal to 33.7 sq. mi.

$$\text{West Branch Watershed} = 33.7 \text{ sq mi} - 0.42 \text{ sq mi} = 33.28$$

use 33.3 sq mi
